

Character foundry

Revise 360 lesson plan — 60 minutes

Unit	OCR J277 1.2 Memory and storage — Paper 1, Computer systems
Lesson	Character foundry (lesson 12 of the unit)
Lesson ID	ms-l12
Experience ID	ms-l12
Plan ID	PLAN-MS-L12
Content version	1269c58ed05d
Website	https://revise360.co.uk/experience.html?id=ms-l12

Big question, outcomes and success criteria

Big question — How does a computer store characters, and what are the implications for the number of bits used?

Prerequisites

The lesson before this one is ms-l11. Pupils should already have finished it: the starter below retrieves from it.

Earlier in the unit: ms-l01, ms-l02, ms-l03, ms-l04, ms-l05, ms-l06, ms-l07, ms-l08, ms-l09-test, ms-l10.

Assessable outcomes

1. **ms-l12-o1** — understand that all data, including text, is represented in binary
2. **ms-l12-o2** — know what is meant by a character set
3. **ms-l12-o3** — understand the relationship between the number of bits and the number of characters
4. **ms-l12-o4** — know about ASCII and Unicode

Success criteria the pupil can check against

Taken from the briefs the independent activities themselves show, so these are the words the pupil sees. Their work has met the outcome when it does these things.

- Use `ord()` to find the code. `ms-l12-s3-a3`

Vocabulary, resources and preparation

Key vocabulary — Character set, Unicode

Resources

SLIDES	presentations/MS_L12_CharacterFoundry_Lesson.pptx
WORKSHEET	worksheets/MS_L12_CharacterFoundry_Worksheet.docx
ONLINE EXPERIENCE	experience.html?id=ms-l12

Before the lesson

1. Sign in on the **teacher dashboard** (`teacher.html`) and open **Class logins**. Enter the class or group and the usernames, one per line, then print the login cards. A pupil cannot sign in without one, so do this before the lesson rather than in it.
2. Print the worksheet, one per pupil.

3. Open the slides and the experience once yourself, on the machine you will be teaching from, so the 360 image is already cached.
4. Check headsets or devices are charged and on the school network.

How pupils get in

1. Go to `topics.html` on `revise360.co.uk`.
2. Sign in with the **username and PIN from the login card**. The class is already set against the card.
3. Choose the topic, then this lesson's card.

Worth knowing before you promise anything. In this build `APP_CONFIG.backendUrl` is empty, so logins, login cards and progress are stored on the device the pupil used. The teacher dashboard says so too. A pupil who moves to a different machine starts again, so keep a class on the same devices within a unit, and treat the paper worksheet as the record that travels.

Teaching sequence

Sixty minutes including transitions. The online block is the one to move if your lesson is shorter: see the adaptation at the end.

MIN	PHASE	TEACHER	PUPILS	EVIDENCE TO CHECK
0-5	Retrieve	Starter on the board or the worksheet, from the last lesson and this lesson's prerequisites.	Answer the starter on the worksheet.	The starter box on <code>MS_L12_CharacterFoundry_Worksheet.docx</code> is filled in.
5-8	Review the starter	Take answers; correct the one most got wrong.	Correct their own starter.	A correction written, not just a tick.
8-18	Explain and model	The new idea in two or three steps, with the example worked in front of the class.	Listen and answer questions about the example.	They can say why, not only what.
18-21	Set up and settle	Sign-in, launch, and what to write before anyone taps an answer.	Sign in, open the lesson, find Text as numbers.	Everyone is in and on station 1.
21-43	Online: work the stations in order	Pupils read each wall, write the key fact and the challenge, then answer at the badge.	Read each wall, write the key fact and the challenge, then answer at the badge.	The worksheet has writing on it for each of the 6 stations before the badge is tapped.
43-48	Check understanding	The hinge question, hands down.	Answer the hinge question, hands down.	The split across the options.
48-56	Apply	Exam practice on the worksheet, in silence.	Exam practice, in silence.	worksheet, Exam practice a) to c)
56-60	Exit and set up the next lesson	The exit question and the retrieval link to next lesson.	Write the exit answer.	One sentence that answers the big question.

The explanation and the worked example

This is what the walls of the experience say, station by station. Teach the first two or three from the front before anyone puts a headset on; the rest the pupils read for themselves.

1. Text as numbers

- Every character has a number, called its character code.

- The code is stored in binary, like any other number.
- The computer uses a character set to know which code means which character.

Challenge on this wall: Convert the first letter of your name into binary.

2. ASCII

- ASCII uses 7 bits, giving 128 different characters.
- It covers English letters, digits, punctuation and control codes.
- Extended ASCII uses 8 bits for 256 characters.

Challenge on this wall: How many characters can 7 bits represent, and why?

3. The ASCII pattern

- Codes are in order: A is 65, B is 66, and so on.
- Lower case starts 32 later: a is 97.
- The digits 0 to 9 are codes 48 to 57.

Challenge on this wall: If A is 65, what is E? And what is e?

4. Unicode

- Unicode was designed to represent every writing system in the world.
- It uses 16 bits or more, giving tens of thousands of characters.
- It includes emoji, and the first 128 codes match ASCII.

Challenge on this wall: Give two advantages and one disadvantage of Unicode compared with ASCII.

5. Bits and characters

- The number of bits decides how many characters can be represented: 2 to the power n.
- 2 bits give 4; 4 bits give 16; 8 bits give 256.
- Add one bit and you double the number of characters.

Challenge on this wall: How many binary combinations are there with 2, 4 and 8 bits?

6. Text file size

- File size = number of characters × bits per character.
- The same message in Unicode is roughly twice the size of 8-bit ASCII.
- Spaces and punctuation count as characters.

Challenge on this wall: Calculate the size of a 1,000-character message in ASCII and in 16-bit Unicode.

Retrieval and the check for understanding

Starter — A vending machine has 4 buttons. How many different combinations of two presses are there? What about 8 buttons?

Answer space: 2 lines on the worksheet.

The answer is in the teacher answers for this unit, not on this plan: a plan left on a desk should not give it away.

Hinge question

Use this one, hands down, before anyone moves on to independent work. It is a real activity from the experience (ms-112-s4-c1), so the wording a pupil sees matches the wording you say.

What is the main advantage of Unicode over ASCII?

Correct: It can represent characters from every writing system, not just English

What a pupil might choose instead

- It uses fewer bits per character
- It makes files smaller

- It is faster to type

Count the hands on each. If more than a few of the class are on one wrong option, that option is the misconception to teach against before anyone goes on: go back to the station this question sits on and work through its example again, aloud, before the independent work.

The course's own response to a wrong answer here: Coverage is the point of Unicode.

One response, not four. one response covers every wrong option; it does not say what to revisit for each one, so decide your own reteach for each option before the lesson - the list above is the start of it.

Guided to independent practice

STAGE	ACTIVITIES	WHAT IT IS
Guided	12	Support is in the activity: an example to run, an output to predict, one thing to change, a gap to fill.
Independent	4	The pupil writes or fixes it with the brief and nothing else.
Challenge	0	The hardest activity on each station. It is not optional and it is not extra: it is the last step of the station.

Scaffolds already in the product, and how they fade

- **Hint** is a ladder, not a door: the first rung names the idea, the next shows the shape of the code, the next how it starts, the last animates the technique on different data. A pupil asks for each rung. None of them is the answer.
- **Run** is free and unmarked; **Check my answer** marks. A pupil may run as often as they like, which is what makes trial and error safe.
- **I need help** says to ask you, and says plainly that the question still has to be completed. It does not notify anyone and it does not unlock anything.
- The worked example appears on every early activity and on none of the late ones. That fade is deliberate; it is not a missing example.

Accessibility

- **Read aloud** on every task window reads the task and its brief, with the prescribed values read as values rather than as punctuation.
- Text is 16px or larger throughout, and a question window scrolls rather than shrinking its type.
- Prescribed data is boxed and in a monospace face as well as coloured, so it still reads as code in black and white, in a high-contrast mode, and to a pupil who does not separate green from amber.
- **Lower literacy and EAL:** pre-teach the vocabulary above; let the pupil say the key fact before writing it; accept the key fact in two or three words.
- **SEND:** the sequence is compulsory but the pace is not. A pupil may finish a station next lesson; the progress saves after every answer and reopens at their earliest unfinished question.
- A headset is never required. Every experience works on a laptop or a tablet with a mouse or a finger.

Delivering the online experience

Before anyone enters

- Worksheet out, pen in hand. The rule is write first, then answer at the badge: the first answer is the one that counts.
- Say where the stations are. They are numbered around the room: 1 and 2 to the right, 3 and 4 behind, 5 and 6 to the left, and the final challenge on the floor.
- Say that a badge marked **Not yet** is not a fault. It opens when the station they are on is finished.

The stations, and what to record at each

#	STATION	ACTIVITIES	RECORD ON PAPER
1	Text as numbers	2	Text is stored as...
2	ASCII	2	ASCII is...
3	The ASCII pattern	3	In ASCII, the codes are ordered so that...

#	STATION	ACTIVITIES	RECORD ON PAPER
4	Unicode	2	Unicode is...
5	Bits and characters	2	The relationship between bits and characters is...
6	Text file size	2	Text file size is calculated by...
final	Final challenge: spell it in binary	3	the answer to the station's challenge

Where to pause

Stop the class after station 2 and take answers to its challenge out loud. That is the point where a pupil who has misread the technique can still be put right cheaply.

Afterwards

Headsets off and down. Ask three pupils for the key fact from a station of your choosing, in their own words and not read off the sheet. Then the exit question.

Assessment, evidence and unfinished work

ID	QUESTION	MARKS	WHERE
ms-112-x1	State what is meant by a character set.	1	worksheet, Exam practice a); deck, Exam practice slide
ms-112-x2	Explain why Unicode uses more storage than ASCII.	2	worksheet, Exam practice b); deck, Exam practice slide
ms-112-x3	A character set uses 8 bits per character. State how many characters it can represent.	1	worksheet, Exam practice c); deck, Exam practice slide

Expected answers

Model answers and marking guidance are teacher-only and are not printed on this plan. They are in the unit's teacher guide pack, and the per-activity marking for this lesson is in `answers/records/ms-112.json`, which is not published with the website.

Common errors

The wrong options the activities offer are the errors this lesson expects. The commonest to watch for:

- **What is a character set?** — A set of fonts; A group of keyboards
- **How many characters can 7-bit ASCII represent?** — 7; 256
- **Why was ASCII not enough for the whole world?** — It was too slow; It used too much storage
- **If A is 65, what is D?** — 66; 67
- **Why is the gap between A and a exactly 32?** — It is a coincidence; There are 32 letters

Unfinished work

Record where each pupil stopped, not a tick. They resume at their earliest unfinished question, and a station left half-done is the thing to open next lesson. Do not mark the lesson complete for a pupil who did not finish it: the score screen already shows what was and was not done, and that is the honest record.

Exit, next lesson and homework

Exit check

One of these, written, not a show of hands:

- What a character set is
- ASCII and Unicode
- Bits, characters and file size

The confidence columns on the worksheet are a supplement to this, not a substitute: a pupil who rates themselves confident and cannot answer the exit question has told you nothing.

Retrieval link to next lesson

Next is ms-113, Pixel studio. Use this lesson's big question as next lesson's starter, so the first thing they do is retrieve it.

Homework

Finish any station left open, on the website, from the question they stopped at. If the class has no devices at home, set the exam practice on the worksheet instead and mark it next lesson.

Shorter lessons, longer lessons and no internet

A 40 to 45 minute lesson

Keep the starter, the explanation and the model at full length: cutting those is what makes the online work fail. Take the time out of the online block and the apply phase. Pupils stop where they are; their progress saves after every answer and reopens at their earliest unfinished question, so the next lesson starts there.

If the internet or the devices are unavailable

Teach from the slides and the worksheet. The slides carry the same teaching as the station walls, and the worksheet carries the key facts, the challenges and the exam practice. Set the online stations when the devices are back.

There is no offline version of the experience, and this plan does not contain one. Do not hand out a printed walkthrough of the stations as a substitute: the experiences are used on the website.
