

# 1.4 Network security

Why this unit is taught the way it is

## What this unit teaches, and where it ends

12 lessons: 10 with an online experience, 1 paper assessment and 1 bonus challenge. 122 activities in all, worth 199 marks.

By the end of it a pupil should be able to:

- understand the different forms of attack against computer systems ns-101
- understand the threats of various forms of malware ns-102
- understand how to identify and protect against malware ns-102
- understand the concept of SQL injection ns-103
- understand how to protect against SQL injection ns-103
- understand what phishing is ns-104
- understand how to identify and protect against phishing ns-104
- understand what phishing is ns-105
- understand how to identify and protect against phishing ns-105
- understand the ways people are a weak point ns-105
- understand what a brute-force attack is ns-106
- understand how to identify and protect against brute-force attacks ns-106
- understand what a denial-of-service attack is ns-107
- understand how to identify and protect against denial-of-service attacks ns-107
- understand the threat that data interception and theft poses ns-108
- understand how to identify and protect against data interception ns-108
- understand the ways people are a weak point in system security ns-109
- know how penetration testing, anti-malware, firewalls and user access levels help against cyberattack ns-109
- know how passwords, encryption and physical security help against cyberattack ns-110
- be able to choose suitable protections for a given threat ns-110

## Why the lessons are in this order

Each lesson's starter retrieves the one before it, so the order is the retrieval schedule as much as the teaching one. The chain for this unit:

| LESSON                  | TEACHES                                                           | RETRIEVES                      |
|-------------------------|-------------------------------------------------------------------|--------------------------------|
| 1 Threat map            | understand the different forms of attack against computer systems | nothing before it in this unit |
| 2 Malware lab           | understand the threats of various forms of malware                | Threat map                     |
| 3 Database break-in     | understand the concept of SQL injection                           | Malware lab                    |
| 4 Phishing inbox        | understand what phishing is                                       | Database break-in              |
| 5 Social engineering HQ | understand what phishing is                                       | Phishing inbox                 |
| 6 Cracking lab          | understand what a brute-force attack is                           | Social engineering HQ          |
| 7 Traffic flood         | understand what a denial-of-service attack is                     | Cracking lab                   |

| LESSON                      | TEACHES                                                                       | RETRIEVES         |
|-----------------------------|-------------------------------------------------------------------------------|-------------------|
| <b>8</b> Packet sniffers    | understand the threat that data interception and theft poses                  | Traffic flood     |
| <b>9</b> Defence depot      | understand the ways people are a weak point in system security                | Packet sniffers   |
| <b>10</b> Defence depot 2   | know how passwords, encryption and physical security help against cyberattack | Defence depot     |
| <b>11</b> End-of-topic test | assesses the whole unit                                                       | Defence depot 2   |
| <b>12</b> Cyber defence     | stretches what is taught                                                      | End-of-topic test |

The assessment in this unit is placed where it is so that the reflection sheet still has lessons left to send a pupil back to.

## What pupils find hard here

None of this unit's walls names a common mistake in so many words. The misconceptions it works against are in the wrong options of its questions instead: every one of those is a plausible wrong idea rather than filler, and the lesson plans list them question by question.

Every multiple-choice and Predict activity in the unit — 107 of them — offers wrong answers that are the misconception, not filler. The split across those options at the hinge question is the cheapest diagnostic in the lesson.

## Where the explaining, modelling and practising happen

| PHASE           | WHERE IT IS                                                                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Retrieve</b> | The starter on the worksheet, before any device is opened. It is answered on paper and corrected before the lesson moves on.                                                                                                                        |
| <b>Explain</b>  | The slides and the station walls carry the same explanation, so a teacher can teach from the front and a pupil can re-read it in the room.                                                                                                          |
| <b>Model</b>    | There is no worked example on screen in this unit: its activities are questions to answer rather than techniques to copy. The modelling is yours, from the slides, before anyone starts - and it is the part to protect when the lesson runs short. |
| <b>Practise</b> | 121 guided activities, then 1 independent ones.                                                                                                                                                                                                     |
| <b>Check</b>    | The badge questions mark as the pupil goes; the hinge question is for the class at once.                                                                                                                                                            |
| <b>Apply</b>    | 0 challenge activities, and the exam practice on the worksheet.                                                                                                                                                                                     |
| <b>Review</b>   | The exit question and the confidence columns. The confidence columns supplement the evidence; they do not stand in for it.                                                                                                                          |

## How the website, the slides and the worksheet divide the work

They are not three copies of the same thing.

- **The slides** are for the front of the room: the explanation and the model, before anyone is working alone.
- **The experience** is where a pupil reads, decides and is marked. It gives the immediate feedback a teacher cannot give thirty pupils at once.
- **The worksheet** is the record and the writing. The key fact in their own words, the station challenge, the exam practice. It is also what survives when the devices do not.

The rule that holds them together is **write first, then answer at the badge**. A pupil who taps first has turned the lesson into a quiz game, and the worksheet is how you can see at a glance who did.

## Why a 360° room, and what it should produce

The room is not there to be impressive. It is there because this unit's content is a set of related parts that a pupil has to hold together, and putting one part on each wall makes the set visible and navigable: a pupil can turn back to station 2

while answering station 4. The evidence it should produce is on paper — 60 key facts and 60 station challenges in a pupil's own words — and in the score screen, which shows which station a pupil lost marks on rather than one number.

No claim is made here that immersion improves learning on its own. What the format does is make the structure of a topic physical and keep a pupil's attention on one part at a time; the teaching is in the explanation, the example and the practice, as it would be anywhere else.

## Support, and how it is taken away

---

- The worked example is on the early activities of a station and not on the late ones. That fade is deliberate.
- The hint is a ladder asked for one rung at a time, and the top of it is still the technique on different data, never the answer.
- Read aloud is on every task.
- Prescribed values are boxed and in a monospace face as well as coloured, so they survive a black-and-white printout and a high-contrast mode.
- **Lower literacy and EAL:** pre-teach the vocabulary (Malware, Social engineering, Virus, Ransomware, SQL injection, Input validation, Phishing, Blagging, Shouldering, Brute-force attack, Password, Denial of service). Accept the key fact spoken before it is written, and in two or three words.
- **SEND:** pace is not fixed. Progress saves after every answer and reopens at the earliest unfinished question, so a pupil may finish a station next lesson without losing anything.
- A headset is never required.

## Checking, and what to do with what you find

---

Three checks, in this order: the starter (did last lesson stick), the hinge question (is the class ready for independent work), the exit question (did this lesson stick). The first two change what you do in the lesson; the third changes what you start the next one with.

When a hinge question splits the class, go back to the station it sits on and work its example again, aloud, before anyone goes on. When a test comes back, the reflection sheet names the topics to revisit and review mode on those lessons reopens exactly the questions a pupil got wrong.

## Where the approach comes from

---

The shape of a lesson here — retrieve, explain, model, practise with support that fades, check, apply, review — is ordinary evidence-informed practice rather than anything this product invented. Useful starting points, none of them about Revise 360:

- Rosenshine, *Principles of Instruction* (American Educator, 2012) — the daily review, small steps, worked examples and checking for understanding that this structure follows.
- Sweller, van Merriënboer and Paas on cognitive load and the worked-example effect — why the example comes before the independent task and why the support is withdrawn gradually.
- Dunlosky et al., *Improving Students' Learning With Effective Learning Techniques* (2013) — the evidence for retrieval practice and spacing, which the starters and the review mode use.
- Wiliam, *Embedded Formative Assessment* — hinge questions and what to do with the answers.

**What is not claimed.** Nothing above is evidence that Revise 360 improves outcomes. No trial of this product has been run, and immersion is not claimed to improve learning by itself. The citations are for the teaching structure; whether these resources work in your classroom is a question your own assessment answers.
